Here's what people testing "Suwannee River" say:

in the last three weeks it has begun to show new leaves, and there ALABAMA: "Last year the water supply in Auburn was extremely low, and we were not allowed to use any for shrubbery, lawns, etc. This plant suffered rather severely from lack of water. Then came the freeze in late March with a temperature of 17° here at Auburn. For a time I thought this plant was completely killed. However,

is every indication that it will recover.

Is every indication that it will recover.

It was well pleased with the appearance of this plant until such extremely adverse conditions practically stopped its growth. In my opinion this should be a very satisfactory shrub for foundation planting." May 1955.

DISTRICT OF COLUMBIA: "Although it was not possible for us to water as regularly as we should have during last summer's extowater as regularly as we should have during last summer's ex-

treme drought, your plants showed no deleterious effects from lack of water. I do not think that we will have any trouble bringing them through any droughts that we may experience in this area.

appeared as numerous small spots over the leaves. With the coming of warm weather and new foliage the worst leaves dropped off. At no time, however, did the plants lose all their leaves or appear completely brown. All plants are growing well now and seem not to have suffered any actual killing back of their stems.

"As for my impression of Suwannee River" as a broad-leaved everhad severe winter burning on many broad leaved evergreens and some on the plants of Suwannee River. The leaf burning on your Ligustrum did not show up until early March, and at that time it years. On two occasions the temperature went as low as 7° F. We "This past winter was the coldest winter we have had in seven

winter at the Arboretum. If our winters do not get any colder than the past one I cannot see why it should not be satisfactory for this and similar climatic areas." May 1955.

DELAWARE: "Both plants are in good condition and the variety seems to be hardy in both the southern and northern part of the tainly it has stood up much better than Ligustrum japonicum this green for this area, I would say that it looks very promising. Cer-

sun and wind burn, but this is common to all of our lucidum privet during severe winter weather in this area. I believe this would make an attractive and useful landscape plant for Delaware." Some winter injury was observed on both plants probably due to

LOUISIANA: "The Suwannee River Ligustrum is now in full bloom and looks good..... It withstood the drought and came through in good condition.

"As a low growing shrub, especially for use around industrial areas, it seems that the Suwannee River Ligustrum would be an excellent choice." May 1955.

MARYLAND: "The 'Suwannee River Ligustrum' plants you sent

for field testing over a year ago have just gone through an unusually severe winter for this part of the country. Several days we had

spring rains and warmth, I can report that they appear to be doing very well." April 1955. temperatures two or three degrees below zero.
"The plants did take a bit of abuse, but now that they are getting

scription of this variety, it is a dwarf type in that it is still not more than two feet in height. This plant, along with a common ligustrum, had started vigorous new growth before the severe freeze occurred on March 26 and 27. All of this tender new growth was killed and the old leaves were damaged to some extent. Except for the tender new growth, no damage has been apparent on the last year's or the tender of the severe damage has been apparent on the last year's or the tender of the severe damage. older wood and the plant is making normal new growth at this time. Our temperature during this unprecedented late freeze on March 27, was officially recorded at 20 degrees Fahrenheit and the temperature remained below freezing for more than twenty-four hours." May 1955. MISSISSIPPI: "... This plant made fairly normal growth and withstood the drought as well as any other plants, particularly compared to the common ligustrum. As indicated from your de-

LONG ISLAND, NEW YORK: "The three Suwannee River Ligustrums were placed in different places so that we would have some basis from which to judge.

(1) "One was placed in a place protected from all winds and received only about 3 or 4 hours sun a day. This plant appears to be in good shape and is already setting out new

"A second was placed in an area where it had protection from wind on three sides and received 5 to 6 hours of sun a day. This did not do as well and showed about 1/4 of the leaves with wind burning. New leaves are coming out in

2

"The third was placed in full sun and completely exposed to the winds. This is in the worst condition with ½ to ½ of the leaves showing wind burn but there are new leaves appearing. The new leaves are not as prolific as in the other

"They certainly show promise but I think it will take another 2 or 3 years in order to judge them well." May 1955. two plants.

it, since it is designed for the low, modern type of architecture. "I think this plant has a definite place and will stand up along with OREGON: ". . . The plant looks perfectly healthy. It has not made a very large amount of growth, and that is as we would want

PENNSYLVANIA: ". . . Both are in good condition; the tips of our azaleas, rhododendrons, skimmia, daphnes and camellias which do so well here." May 1955. most of the upper leaves are browned, but there is plenty of new

growth, two to three inches long.
"Both are planted in protected spots, one more so than the other and that one started into growth a little earlier.

was very cold with little snow. In my opinion the ligustrums came thru exceptionally well." May 1955. did much watering. The ligustrums received extra waterings. The first part of the winter was mild, but the whole month of February "As to weather conditions; last summer was hot and dry and we

TEXAS: "The plants are certainly nice and should please our most exacting customers." October 1954.
